SERVICE & INSTALLATION MANUAL

FOR YOUR SAFETY

WARNING: If the information in these instructions is not followed exactly, a fire or explosion may result causing property damage, injury, or death.

- Do not store or use gasoline or other flammable vapors or liquids in the vicinity of this or any other appliance.

WHAT TO DO IF YOU SMELL GAS:

- Do not try to light any appliance.
- Do not touch any electrical switch; do not use any phone in your building.
- Immediately call your gas supplier from a neighbor's phone. Follow the gas supplier's instructions.
- If you cannot reach your gas supplier, call the fire department.
 - Installation and service must be performed by a qualified installer, service agency, or the gas supplier.

FOR YOUR SAFETY

This product must be installed and serviced by authorized personnel, qualified in pool/ spa heater installation. Improper installation and/or operation can create carbon monoxide gas and flue gases that can cause serious injury, property damage, or death.

Figure 8: Sub-Assemblies

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

GAS SUPPLY AND PIPING:

To properly size the gas piping for the heater, refer to Tables 10, 11, 12, and 13, depending on natural or propane gas, and single-stage or 2-stage regulation. Follow local gas codes for proper gas line material selection (copper, iron, plastic, etc.). It is VERY IMPORTANT when installing a propane heater on a 2-stage regulation system to follow the gas line sizing data in Table 13 without exception.

Table 10
Natural Gas Pipe Sizing, Low-Pressure, Single-Stage Regulation

Distance from Gas Meter to Heater Gas Valve Inlet	Model	H150FDN	H200FDN	H250FDN	H300FDN	H350FDN	H400FDN	H500FDN
	btu/hr input	150,000	200,000	250,000	300,000	350,000	400,000	500,000

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

GAS SUPPLY INSTALLATION:

The heater is shipped from the factory with the gas connection located on the left-hand side of the heater cabinet. Insert the pipe to the gas valve through the grommet in the cabinet side (see Figure 10.) A union should be installed outside the heater cabinet for easy removal of the gas manifold assembly during service. A CSA certified main gas shutoff valve must be installed outside the cabinet and within 6 feet of the heater. This valve must have an I.D. large enough to supply the proper amount of gas volume to the heater. See Figure 9.

⚠ ATTENTION: Apply joint compound (pipe dope) sparingly and only to the male threads of pipe joints. Do not apply joint compound to the first two threads. Use joint compounds resistant to the action of liquefied petroleum gas. Do not overtighten the gas inlet pipe or damage may result.

⚠ ATTENTION : Do not use flexible appliance connectors on any gas connections unless the connector is CSA approved for outdoor installation, is marked with BTUH capacity (which must be equal to or greater than the heater rated input) and the type of gas (natural or LP).

Reduction of gas supply pipe or tubing to the inlet of the heater gas valve must be made at the valve only and must match the valve inlet size (3/4" or 1" NPT). If more than one appliance is installed on the gas line, consult the local gas company for the proper gas line size.

Questions on the installation of the proper gas line size can be directed to Hayward Technical Service.

NATURAL GAS:

The gas meter must have the capacity to supply enough gas to the pool heater and any other gas appliances if they are on the same pipeline (Example: 225 meter = 225,000 BTUH). If doubt exists as to the meter size, consult the local gas utility for assistance. Natural gas must be "pipeline quality" supplied from a natural gas utility company. Hayward will not be responsible for heaters that soot up due to improper meter and gas line sizing resulting in improper gas volume, or heaters that are damaged in any way if connected to a natural gas well.

PROPANE GAS:

All propane gas tanks must be located outdoors and away from pool/spa structure and in accordance with the standard for storage and handling of propane gas, ANSI/NFPA 58 (latest edition) and applicable local codes. If the propane gas tank is installed underground, the discharge of the regulator vent must be above the highest probable water level.

Propane tanks must have sufficient capacity to provide adequate vaporization for the full capacity of the equipment at the lowest expected temperatures. Consult a propane company expert for correct sizing.

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

⚠ ATTENTION: Whenever a high-pressure double regulation system is utilized for propane gas, consult a propane expert for accurate pipe and pressure sizing. Make sure that 1st and 2nd stage regulators are large enough to handle the BTUH input listed for the heater(s) being used. Hayward will not be responsible for heaters that soot up due to improper gas line or propane tank sizing resulting in improper gas volume.

WATER PIPING:

The heater is designed for use with pool and spa/hot tub water only, as furnished by municipal water distribution systems. The warranty does not cover heater use with mineral water, seawater (PPM>5000), or other non-potable waters.

Do not install any restriction in the water pipe between the heater outlet and the pool/spa with the exception of:

1. three-way switching valve
2. in-line chlorinator
3. chlorinator check valve

WARNING: EXPLOSION HAZARD Blockage of water flow from heater return to pool may result in fire or explosion causing property damage, personal injury, or loss of life.

The heater is equipped with CPVC flanged pipe nipples to accommodate water piping to and from the pool or spa. These pipe nipples will accept piping by solvent welding (PVC glue). The fittings will accept either a 2" pipe, or a 2 1/2" pipe fitting, and seal to the heater header with rubber gaskets. On plastic headers, the fittings are secured in place with plastic union nuts, and on bronze headers (ASME models), the fittings are secured in place with bolts. Assemble these parts to the heater prior to plumbing. Tighten union nuts (or bolts) securely before gluing fittings to the ends of the pipe nipples. See Figure 11.

The CPVC flanged pipe nipples must be installed on the heater inlet and outlet without modification. Pipe, fittings, valves, and any other element of the filter system may be made of plastic materials, if acceptable to the authority having jurisdiction.

Heat sinks, heat tapes, firemen switches, and check valves are not required on the heater. However, if there is any chance of "back-siphoning" of hot water when the pump stops running, it is suggested that a check valve be used on the heater inlet pipe.

The built-in bypass inside the header will maintain proper flow through the heat exchanger if the flow rate is within the range for the heater. See Table 14. The minimum flow rate is to be calculated or measured with the in-floor cleaning system in use, if the pool is so equipped, as well as any other jets or other demands on the water flow.

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

If the normal pump and filter system flow rate exceeds 125 gpm then a manual bypass valve must be installed as shown in Figure 12. Damage caused by flow rates outside this range will void the manufacturer's warranty.

The installation is as follows:

1. Install a flow meter on the outlet line of the heater.
2. Adjust the manual bypass valve until the flow rate is within the flow rate range specified for the heater.
3. Once the valve is set, note the position and remove the valve handle to prevent further adjustment.

Table 14: Allowable Water Flow Rate Range

Model	Minimum Flow Rate (GPM)	Maximum Flow Rate (GPM)
H150FD H200FD	20	125
H250FD H300FD	25	125
H350FD H400FD	30	125
H500FD	40	125

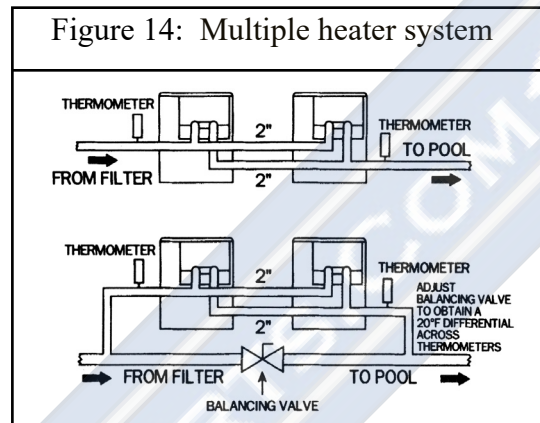

ATTENTION: Improperly adjusted manual bypass valves will result in damage to the heater if the flow rates are not maintained as specified in Table 14 under all operating conditions. The heat exchanger will fail and this damage will not be covered under the Hayward warranty.

Figure 12: Manual Bypass valve

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

Figure 13 illustrates a typical pool piping diagram and layout for the pool equipment. Figure 14 illustrates a multiple heater installation for very large pools with and without a manual bypass valve.

INSTALLATION ABOVE POOL/SPA SURFACE:

If the heater is installed less than three (3) feet above the surface of the pool/spa water, install eyeball fittings or directional flow fittings on the end of the return water line to the pool/spa to create adequate back pressure at the heater to operate the pressure safety switch when the filter pump is running.

If the heater is installed more than three (3) feet above the surface of the pool/spa water, install a loop as shown in Figure 15 to prevent drainage of water in the heater during a filter change.

For installation below the pool/spa surface, refer to Section III.

Figure 15: Heater installation above pool/spa

AUTOMATIC CHLORINATORS AND CHEMICAL FEEDERS:

If used, a chlorinator must be installed downstream from the heater in the pool return line and at a lower elevation than the heater as shown in Figure 16. Install a separate positive seal corrosion resistant check valve between the heater outlet and the chlorinator to prevent highly concentrated sanitizer from back siphoning into the heater. Back siphoning usually occurs when the pump is shut off and a pressure differential is created.

Figure 16: Automatic chlorinator

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

DRAIN VALVE INSTALLATION (ASME MODELS ONLY):

If installing an ASME model heater, a 3/4" brass drain valve must be installed. A suitable drain valve is included separately with all ASME heaters. Apply a suitable amount of pipe thread sealant or Teflon tape to the threads and install as shown in Figure 17.

PRESSURE RELIEF VALVE (ASME MODELS ONLY):

If installing an ASME model heater, a 3/4" pressure-relief valve having a discharge capacity greater than or equal to the Btu/hr input of the heater, and a pressure rating equal to or less than the working pressure must be installed. See the rating plate located inside the front access panel on the heater for the input rating and working pressure. A suitable pressure relief valve is included separately with all ASME heaters. Apply a suitable amount of pipe thread sealant or Teflon tape to the threads and install as shown in Figure 17. Please note that the drain valve must be installed before the pressure relief valve. Install the pressure relief valve with the discharge connection facing the ground. If necessary, connect a pipe (of the same size as the valve outlet) to the outlet and run it to a safe place of discharge. Do not install any shut-off or restriction in this drain line.

PRESSURE RELIEF VALVE (NON-ASME MODELS ONLY):

Some local building codes require a pressure relief valve for non-ASME pool/spa heaters. The plastic header has a 3/4" port which can be used for this purpose (see Figure 24 for location of port). A 3/4" pressure relief valve having a discharge capacity greater than or equal to the Btu/hr input of the heater, and a pressure rating equal to or less than the working pressure is recommended. See the rating plate located inside the front access panel on the heater for the input rating and working pressure. If desired, you may order the pressure relief valve from Hayward; order p/n CHXRLV1930. Remove the factory-installed pipe plug, and install the pressure relief valve using a suitable amount of pipe thread sealant or Teflon tape on the threads. Install the pressure relief valve with the discharge connection facing the ground. If necessary, connect a pipe (of the same size as the valve outlet) to the outlet and run it to a safe place of discharge. Do not install any shut-off or restriction in this drain line.

ELECTRICAL SPECIFICATIONS:

WARNING: It is required that licensed electricians do all electrical wiring. Risk of Electric Shock. Hazardous voltage can shock, burn, and cause death or serious property damage. To reduce the risk of electric shock, do NOT use an extension cord to connect unit to electric supply. Provide a properly located electrical receptacle. All electrical wiring MUST be in conformance with applicable local and national codes and regulations. Before working on heater, turn off power supply.

GENERAL INFORMATION:

Wiring connections must be made as shown in the wiring diagram found inside the heater cabinet, and as shown in Figure 19. The heater must include a definite means of grounding and bonding. There is a ground lug inside the control box and a bonding lug on the side of the heater.

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

MAIN POWER:

 **WARNING** - Power connections supplied to the heater must be in accordance with National Electric Code (NEC) and local electric codes. The NEC contains no standards requiring Ground-Fault Interruption protection (via GFI Circuit Breaker or otherwise) of “Fixed” or “Stationary” equipment, under article 680: Swimming Pools, Fountains, & Similar Installations.

BONDING:

 **CAUTION** - This heater must be connected to a bonding grid with a solid copper conductor wire gauge 8 AWG or larger. All Hayward heaters are designed for copper conductors only. The National Electrical Code (NEC), and most other codes require that all metallic components of a pool structure, including reinforcing steel, metal fittings and above ground equipment, be bonded together with a solid copper conductor wire gauge 8 AWG or larger. The heater, along with pumps and other pool equipment must be connected to this bonding grid. A bonding lug is provided on the side of the heater to ensure that this requirement is met.

ELECTRICAL CONNECTIONS:

The heater is equipped with a hot surface ignition control system that automatically lights the burners. An external power supply is required to power the control system. The electrical specifications for this heater are 120/240VAC, 60Hz, 1-phase, 5.5A maximum current. It is recommended that circuit protection for the heater circuit be rated at 15 Amperes.

The heater is shipped from the factory wired for use with 240VAC, 60 Hz field power supply. To convert the heater to 120VAC, 60 Hz operation remove the 240VAC voltage selector jumper from the ignition control board and replace it with the 120VAC jumper. These jumpers are tie-wrapped together and are located on the fuse board. See Figure 21 for location of the fuse board. All wiring connections to the heater must be made in accordance with the latest edition of the National Electrical Code ANSI/NFPA 70, unless local code requirements specify otherwise. In Canada, follow CSA C22.1 Canadian Electrical Code, Part 1. The heater must be electrically grounded and bonded in accordance with local codes or, in the absence of local codes, with National Electrical Code, ANSI/NFPA 70. The heater may be installed with the electrical service and remote control entering the heater cabinet on either the left or right sides of the heater. The heater is equipped with (4) openings for electrical entry. Any unused openings must be plugged (these are supplied). Field power wiring connections are to be made to the terminal block located in the upper compartment inside the junction box (see Figure 18). The heater has 2 junction boxes (one on each side of the heater). Only one junction box should be used for field power wiring.

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

REMOTE CONTROL CONNECTION:

The heater is equipped for connection to an external 2-wire remote thermostat or a 3-wire remote switch. A 2-wire thermostat has its own temperature sensor for regulating water temperature. A 3-wire remote switch allows the “POOL” or “SPA” models to be remotely selected. Connect remote wiring to the terminal block located in the lower compartment inside the junction box (see Figure 18). The heater has 2 junction boxes (one on each side of the heater). Only one junction box should be used for remote wiring. Do not remove the wires connected to the remote connection terminal block. Remote wiring must be run in a separate conduit. Use 22 AWG wire for runs less than 30 feet. Use 20 AWG wire for runs over 30 feet. The maximum allowable run is 200 feet.

Figure 18: Junction Box connections

2-WIRE REMOTE CONTROL CONNECTION:

To configure the heater for 2-wire remote thermostat control, use the “MODE” key on the heater keypad to put the control into “STANDBY” mode. Then press and hold both the “(-)” and “MODE” keys for 3 seconds until the display shows the code “bo”.

On the remote control wiring terminal block (Figure 18), connect the appropriate wires from the remote control to the terminals adjacent to the ORANGE wire (“POOL”) and WHITE wire (“24V”).

To operate the heater by remote thermostat, the heater’s control must be in either “POOL” or “SPA” mode. The display will show “bo”. The “POOL” or “SPA” LED will be illuminated. The remote thermostat will operate the heater. The heater’s thermostat will function to limit the water temperature to a maximum of 104°F.

3-WIRE REMOTE CONTROL CONNECTION:

On the remote control wiring terminal block (Figure 18), connect the appropriate wires from the remote control to the terminals adjacent to the ORANGE wire (“POOL”), WHITE wire (“24V”), and RED wire (“SPA”). To operate the heater with a remote 3-wire switch, the heater’s control must be in “STANDBY” mode. The “STANDBY” LED will be illuminated. When the remote switch is set to “Pool/Low” the “POOL” LED will be illuminated and the water temperature will be displayed. When the remote switch is set to “Spa/High” the “SPA” LED will be illuminated and the water temperature will be displayed. The heater will use its internal thermostat to regulate the water temperature to the set point of the mode selected.

Figure 20:
Lighting &
Operating
Instructions label

FOR YOUR SAFETY READ BEFORE LIGHTING

WARNING: If you do not follow these instructions exactly, a fire or explosion may result causing property damage, personal injury or loss of life.

- This appliance does not have a pilot. It is equipped with an ignition device which automatically lights the burners. Do **not** try to light the burners by hand.
- BEFORE LIGHTING** smell all around the appliance area for gas. Be sure to smell next to the floor because some gas is heavier than air and will settle on the floor.
WHAT TO DO IF YOU SMELL GAS
 - Do not try to light any appliances.
 - Do not touch any electric switch; do not use any phone in your building.
 - Immediately call your gas supplier from a neighbor's phone. Follow the gas supplier's instructions.
 - If you cannot reach your gas supplier, call the fire department.
- Use only your hand to turn the gas control knob. Never use tools. If the knob will not turn by hand, don't try to repair it; call a qualified service technician. Force or attempted repair may result in a fire or explosion.
- Do not use this appliance if any part has been under water. Immediately call a qualified service technician to inspect the appliance and to replace any part of the control system and any gas control which has been under water.
- Should over-heating occur, or the gas supply fails to shut off, turn off manual gas valve to the appliance.

POUR VOTRE SÉCURITÉ LIRE AVANT L'ALLUMAGE

MISE EN GARDE: Si vous ne suivez pas exactement ces instructions, un incendie ou une explosion pourrait survenir et causer des dommages à la propriété, des blessures corporelles ou la perte de la vie.

- Cet appareil n'a pas de pilote. Un mécanisme d'allumage automatique pour les brûleurs. N'essayer pas d'allumer les brûleurs à la main.
- AVANT L'ALLUMAGE**, sentir tout autour de l'appareil pour détecter d'éventuelles odeurs de gaz. S'assurer de sentir près du plancher parce que les gaz plus lourds que l'air, se concentrent au niveau du plancher.
QUE FAIRE EN PRÉSENCE D'ODEURS DE GAZ:
 - Ne pas essayer d'allumer l'appareil.
 - Ne pas toucher à un commutateur électrique; Ne pas utiliser le téléphone dans la maison.
 - Appeler immédiatement fournisseur de gaz chez un voisin. Suivre les instructions du fournisseur de gaz.
 - Si le fournisseur ne peut pas être atteint, appeler le service des incendies.
- Utiliser uniquement les mains pour actionner les boutons de commande du gaz. Ne jamais utiliser d'outils. Si le bouton ne s'enfonce pas ou ne se tourne pas à la main, ne pas essayer de le réparer. Appeler un technicien qualifié. L'utilisation de la force ou une tentative de réparation pourrait causer un incendie ou une explosion.
- Ne pas utiliser cet appareil si une des composantes a été immergée dans l'eau. Appeler immédiatement un technicien qualifié pour vérifier l'appareil et remplacer toute composante du système de commande ou de gaz qui aurait été immergée dans l'eau.
- Si le système surchauffait ou si le gaz refusait de se fermer, placer le robinet d'arrêt manuel de gaz de l'appareil en position "FERMÉ" (OFF).

OPERATING INSTRUCTIONS

- STOP!** Read the safety information on this label.
- Change the "MODE" on the control panel to "STANDBY".
- Remove the heater's front access panel.
- This appliance is equipped with an ignition device which automatically lights the burner. Do not try to light the burners by hand.
- Turn gas control knob clockwise to "OFF".

GAS CONTROL
KNOB SHOWN
IN "OFF"
POSITION

- Wait five (5) minutes to clear out any gas. If you then smell gas, STOP! Follow "B" in the

- safety information on this label. If you don't smell gas, go to the next step.
- Turn gas control knob counterclockwise to "ON".
 - Replace the heater's front access panel.
 - Set the "MODE" on the control panel to "SPA" or "POOL".
 - Set the set point temperature on the control panel to the desired setting.
 - If the appliance does not operate, repeat steps 2 thru 10. If the appliance still does not operate, follow instructions "TO TURN OFF GAS TO APPLIANCE" and call your service technician or gas supplier.

TO TURN OFF GAS TO APPLIANCE

- Change the "MODE" on the control panel to "STANDBY".
- Remove the heater's front access panel.
- Turn the gas control knob clockwise to "OFF".
- Replace the heater's front access panel.

INSTRUCTIONS D'ALLUMAGE

- STOP!** Lire les consignes de sécurité sur cette étiquette.
- Changer le MODE du tableau de commande à STANDBY.
- Retirer le panneau d'accès avant de l'appareil de chauffage.
- Cet appareil est pourvu d'un dispositif d'allumage qui allume automatiquement les brûleurs. Ne pas tenter d'allumer manuellement les brûleurs.
- Tourner le bouton de commande du gaz en sens horaire à OFF (fermé).

BOUTON DE
COMMANDE
DE GAZ MONTRÉ
EN POSITION
"FERMÉ" (OFF)

- Attendre cinq (5) minutes que tout gaz se dissipe. Arrêter si l'on sent alors une odeur de gaz. Suivre B dans les consignes de sécurité de cette étiquette.

- Passer à l'étape suivante en l'absence d'odeur de gaz.
- Tourner le bouton de commande du gaz en sens anti-horaire à ON (OUVERT).
 - Remplacer le panneau d'accès avant de l'appareil de chauffage.
 - Régler le MODE du tableau de commande à SPA ou à POOL.
 - Établir la valeur de réglage sur le tableau de commande à la température désirée.
 - Si l'appareil ne fonctionne pas, répéter les étapes 2 à 10. Si l'appareil refuse toujours de "FERMÉ" fonctionner, dissipe. Suivre les instructions *Pour tourner le gaz à l'appareil* et appeler votre technicien de service ou votre fournisseur de gaz.

POUR FERMER LE GAZ SUR L'APPAREIL

- Changer le MODE du tableau de commande à STANDBY.
- Retirer le panneau d'accès avant de l'appareil de chauffage.
- Tourner le bouton de commande du gaz en sens horaire à OFF (fermé).
- Remplacer le panneau d'accès avant de l'appareil de chauffage.

SECTION III. INSTALLER CHECK-OUT AND START-UP

GENERAL:

Some of the following procedures will require the heater to be operating. Full lighting and shutdown instructions are included on the lighting and operating label affixed to the inside of the front access panel. The heater automatically lights in response to a call for heat, and automatically shuts down when that call for heat is satisfied. Water must be flowing through the heater during operation. Check that the pump is operating and the system is filled with water and purged of all air prior to starting the heater.

Figure 21: Location of Components

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

GAS LINE TESTING:

The appliance and its gas connection must be leak tested before placing the appliance in operation. The heater and its individual shutoff valve must be disconnected from the gas supply during any pressure testing of that system at test pressure in excess of ½ psig (3.45 kPa). The heater must be isolated from the gas supply piping system by closing its individual manual shutoff valve during any pressure testing of the gas supply piping system at test pressure equal to or less than ½ psig (3.45 kPa).

Gas supply line must be capped when not connected. After pressure testing, reconnect the gas piping to the gas valve. Turn gas supply “ON” and test all pipe and tubing joints for leaks. Use a soap and water solution.

WARNING - EXPLOSIVE HAZARD Gas leaks could cause an explosion resulting in severe injury and/or death. Shut off gas and fix even the smallest leak right away. Be sure to leak test the heater gas manifold fittings using the above procedure once the heater is in operation.

GAS PRESSURE TESTING:

The following gas pressure requirements are important to the proper operation of the burners in gas heaters. Improper gas pressure or gas volume will create the following conditions:

1. Flame burns totally yellow.
2. Flame lifts off burner.
3. Heat exchanger soots up. The gas pressure regulator on all heaters is preset at the factory, but the setting should be verified by the installer to ensure proper operation.

If gas pressure is inadequate, check for undersize piping between the gas meter and the heater or for a low-capacity gas meter.

GAS PRESSURE TEST PROCEDURE:

Refer to Figure 22 for the location components used in this procedure on the specific model of UHS heater being serviced.

Figure 22: Gas Valves

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

HAYWARD Pool Products
A Hayward Industries, Inc. Company

1. Obtain the necessary equipment:
 - a. Manometer to read pressure in inches of water column
 - b. 1/8" pipe nipple (1/8" thread x 1" long)
 - c. 3/16" hex wrench
 - d. Flat screwdriver
2. Remove the 1/8" plug from the gas valve.
3. Install the 1/8" pipe nipple into the gas valve.
4. Attach the manometer to the pipe nipple.
5. Turn on the water system and start the heater following the lighting & operating instructions on the label affixed inside the front access panel. If there is more than one pool/spa heater connected to the gas supply line, turn each of those appliances "ON" while testing the heater.
6. Take a pressure reading with the heater running, the value should agree with those in Table 15. If the pressure is within the range of 1.8" - 2.0" w.c. (natural) or 6.8" - 7.0" w.c. (propane), then no further adjustment is needed.
7. If the gas pressure does not meet the above requirements the regulator must be adjusted.
8. Gas pressure regulator adjustment procedure:
 - a. Remove the screw cap over the regulator adjustment screw (see Figure 20).
 - b. Turn the regulator adjustment screw clockwise to increase pressure and counter-clockwise to decrease pressure.
 - c. Replace the screw cap over the regulator adjustment screw.

Table 15: Correct gas pressures		
Pressure, in. w.c.	FDN	FDP
Manifold	Natural	Propane
	1.8" - 2.0" w.c.	6.8" - 7.0" w.c.
Inlet, minimum	4.5" w.c.	10.0" w.c.
Inlet, maximum	10.5" w.c.	13.0" w.c.

WARNING EXPLOSION HAZARD: Do not remove the 1/8" pipe nipple with the valve in the "ON" position. The valve must be in the "OFF" position when the nipple is removed. Removal of the nipple with the gas valve "on" could cause an explosion resulting in severe injury and/or death.

9. Remove the 1/8" pipe nipple and replace the 1/8" pipe plug. If proper pressure cannot be achieved by adjusting the gas valve regulator, the installer must contact the gas supplier and request that the inlet pressure to the heater be set to within the gas pressure range shown in Table 15.

WARNING EXPLOSION HAZARD: Gas pressures in excess of those listed in Table 15 could cause a gas leak or diaphragm rupture. Gas leakage could cause an explosion resulting in severe injury or death.

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

WATER PRESSURE SWITCH TEST / ADJUSTMENT PROCEDURE:

The pressure switch is preset at the factory for most typical, deck level installations. When the heater is located above or below the level of the pool or spa, the pressure switch may require adjustment to compensate for the change in static head pressure. The following procedure is recommended when the switch needs adjustment and/or is replaced:

For Installations with Heater Above Water Level:

1. Be sure the filter is clean before making the adjustment.
2. Turn "ON" the filter pump and ensure all air is out of the water lines, and ensure water flow rate is at least the rated minimum (see Table 14).
3. Turn "ON" the heater and adjust the thermostat to create a call for heat.
4. If the heater does not light, adjust the pressure switch by turning the adjustment knob on the pressure switch counter-clockwise, until the heater lights. Turning the adjustment knob counterclockwise decreases the pressure needed to close the switch.
5. Check the function of the pressure switch by turning the filter pump on and off several times. The pool heater should turn off immediately when the pump is turned off. Never allow the heater to operate with less than the minimum rated water flow rate.

For Installations with Heater Below Water Level:

1. Be sure the filter is clean before making the adjustment.
2. Turn "ON" the filter pump and ensure all air is out of the water lines, and ensure water flow rate is at least the rated minimum (see Table 14).
3. Turn "ON" the heater and adjust the thermostat to create a call for heat.
4. Turn the adjustment knob on the pressure switch clockwise, until the heater turns off, then turn the knob $\frac{1}{4}$ turn counter-clockwise, so that the heater turns back on. Turning the adjustment knob clockwise increases the pressure needed to close the switch.
5. Check the function of the pressure switch by turning the filter pump on and off several times. The pool heater should turn off immediately when the pump is turned off. Never allow the heater to operate with less than the minimum rated water flow rate.

TWO-SPEED PUMP:

In a few cases the pressure from a two-speed pump is below the 1- pound minimum required to operate the water pressure switch on the heater. This is apparent when the pressure switch cannot be further adjusted. In these cases the pump must be run at high speed to operate the heater. If the pump and piping arrangement are such that the required 1-pound minimum pressure cannot be obtained, do not attempt to operate the heater. Correct the installation.

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

TEMPERATURE ADJUSTMENT:

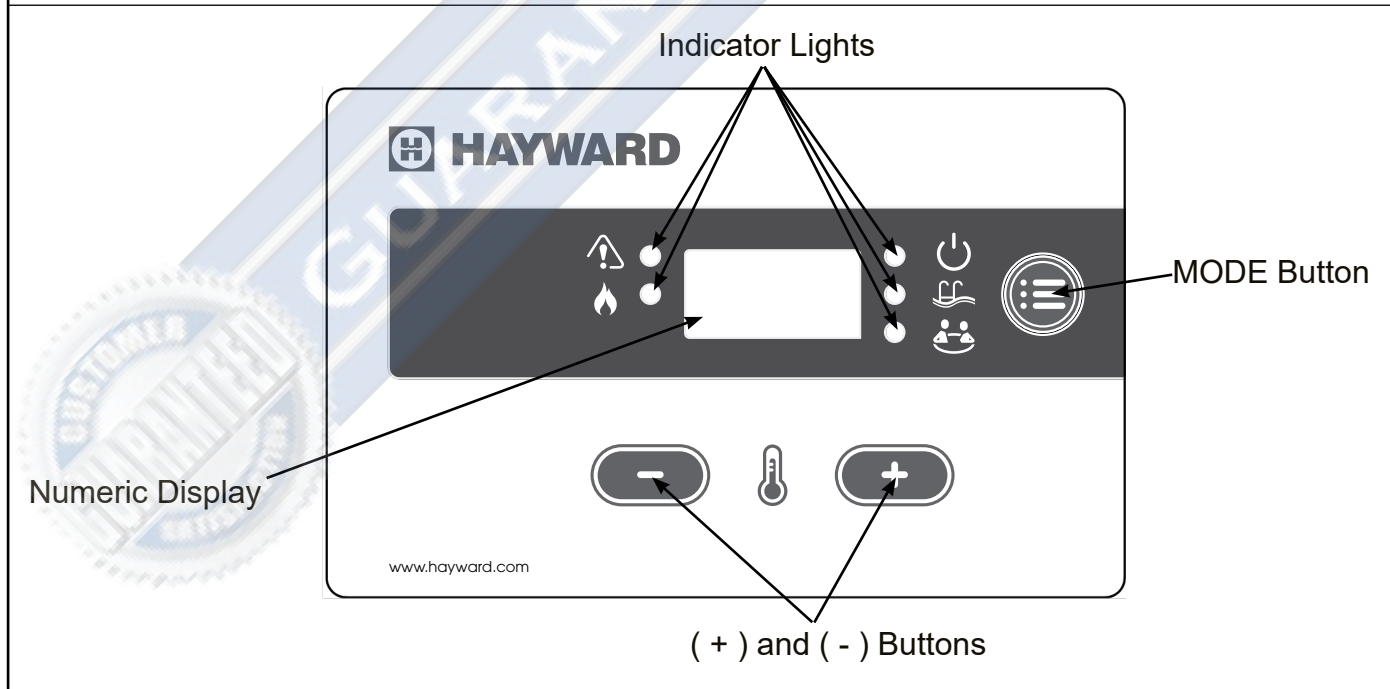

This pool heater is equipped with a digital thermostat which allows the user to select the desired water temperature. The heater will then function automatically to maintain the desired temperature. The heater has 3 modes of operation:

1. **STANDBY:** in this mode, the heater will not function to heat the water.
2. **SPA:** in this mode, the heater will automatically function to maintain the water temperature setting for SPA mode.
3. **POOL:** in this mode, the heater will automatically function to maintain the water temperature setting for POOL mode.

Use the **MODE** button to change modes. The indicator lights will illuminate to show which mode the heater is currently in. Each mode has its own temperature setting, allowing the user to have 2 individual preset temperature settings. To adjust the temperature while in SPA or POOL mode, use the **(+)** and **(-)** buttons. The numeric display will flash to indicate the temperature setting is being displayed / adjusted. When the numeric display is not flashing, the actual water temperature is being displayed. The temperature settings for both SPA and POOL modes are initially set at the factory to 65°F. The minimum allowed settings for SPA and POOL modes are both 65°F. The maximum allowed settings for SPA and POOL modes are adjustable up to 104°F using the temperature lockout feature (see below).

After selecting SPA or POOL mode or adjusting the temperature setting, it is normal for the heater to delay up to 10 seconds before the heater starts operating. This delay is an internal self-test of the heater. On occasion, the numeric display may show a diagnostic error code; refer to list of diagnostic error codes in Figure 27. Pressing the **MODE** button to cycle to STANDBY and back to SPA or POOL will clear a diagnostic error code. When clearing a diagnostic error code this way, it is normal for the heater to delay up to 5 seconds before resuming normal operation, assuming the diagnostic error code does not re-appear.

Figure 23: User Interface Keypad

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

TEMPERATURE LOCK-OUT:

The digital thermostat in this pool heater allows the user to lock the maximum temperature setting allowed. This feature is useful for preventing unauthorized users from manually adjusting the temperature settings higher than desired. On a new heater, the maximum allowed temperature lock settings are initially set at the factory to 90°F for POOL mode, and 104°F for SPA mode. To adjust these settings, use the following procedure:

1. Use the MODE button to put the heater in STANDBY mode.
2. Press and hold both the (+) and (-) buttons at the same time.
3. After 3 seconds, the thermostat enters maximum temperature lock adjustment mode.
4. The SPA indicator light illuminates and the numeric display shows the current SPA mode maximum temperature lock setting. Both the SPA indicator light and the numeric display flashes rapidly when in adjustment mode.
5. Use the (+) and (-) buttons to set the desired maximum temperature lock setting. When finished, press the MODE button.
6. The POOL indicator light illuminates and the numeric display shows the current POOL mode maximum temperature lock setting. Both the POOL indicator light and the numeric display flashes rapidly when in adjustment mode.
7. Use the (+) and (-) buttons to set the desired maximum temperature lock. When finished, press the MODE button.
8. The heater will return to STANDBY mode

FAHRENHEIT VERSUS CELSIUS:

The temperature can be displayed in Fahrenheit or Celsius. TO change the display, use the “MODE” button to place the heater in “STANDBY”. Then press and hold the “(+)” and “MODE” buttons until the display shows the °F/°C selection. Press the “(-)” button to toggle between selections. To accept the selection, press the “MODE” button. If the user does not act, the selection will be automatically accepted after 60 seconds.

HEATING MODE:

The control continually compares the water temperature with the set point and the high limit temperature. When the water temperature is more than 1° below the set point a call for heat is generated and a heating cycle is initiated.

1. The control checks for open contacts at the blower vacuum switch.
2. The control energizes the blower and the igniter. The igniter heat-up time is approximately 20 seconds. The blower is running a pre-purge cycle during this time.
3. The control checks for closed contacts at the blower vacuum switch.
4. When the igniter reaches the proper temperature a 4-second trial for ignition begins. The control opens the gas valve and monitors flame current. The igniter is turned off when flame is sensed or after 4 seconds.
5. The blower vacuum switch, the temperature limit switches, the vent pressure switch, the water pressure switch, the water temperature sensors, and the flame sensor are constantly monitored during a call for heat to assure the heater is operating properly.
6. When the thermostat is satisfied and the call for heat ends the control immediately de-energizes the gas valve. Flame is extinguished.
7. The control operates the blower during a 30-second post-purge period.

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

FAILURE TO LIGHT – RETry:

If the first ignition attempt fails during a normal heating cycle the control will make two (2) additional ignition attempts:

1. The control de-energizes the gas valve after the 4-second ignition trial ends.
2. The control operates the blower during a 30-second post-purge period.
3. The control monitors for open contacts at the blower vacuum switch.
4. The control performs a gas valve relay check.
5. A normal ignition sequence resumes with Item #2 in “Heating Mode” (above). If the third ignition trial fails the control enters a safety lockout (or “hard” lockout) after the post purge period of the third failed trial.
6. The error code “IF” is displayed and the “SERVICE” indicator is illuminated.
 - a. The control automatically resets and clears the “IF” error code without any user intervention after 60 minutes. If there is a call for heat after reset the control will make three (3) trials for ignition. If ignition is not established the control will again enter safety lockout for 60 minutes. This cycle will continue until ignition is established or the call for heat is removed.
 - b. The user can reset the control and clear the “IF” error code by pressing the “MODE” button to move through “STANDBy” and return to the previous mode (“SPA” or “POOL”).

LOSS OF FLAME – RECYCLE:

If flame is established and then lost, the control will make ten (10) attempts at ignition. If flame is lost within ten (10) seconds of ignition the control will respond within 2 seconds. If flame is lost more than ten (10) seconds after ignition the control will respond within 0.8 seconds.

1. The control de-energizes the gas valve and the blower.
2. The control monitors for open contacts at the blower vacuum switch.
3. The control performs a gas valve relay check.
4. A normal ignition sequence resumes with Item #2 in “Heating Mode” (above).
5. If the tenth ignition trial fails the control enters a safety lockout (or “hard” lockout) after the post-purge period of the tenth failed trial.
6. The error code “IF” is displayed and the “SERVICE” indicator is illuminated.
 - a. The control automatically resets after 60 minutes. If there is a call for heat after reset the control will make three (3) trials for ignition. If ignition is not established the control will again enter safety lockout for 60 minutes. If flame is established but is lost the control will make ten (10) attempts at ignition. This cycle will continue until ignition is established or the call for heat is removed.
 - b. The user can reset the control and clear the “IF” error code by pressing the “MODE” button to move through “STANDBy” and return to the previous mode (“SPA” or “POOL”).

KEYPAD INPUTS:

The control accepts user inputs via the keypad on the front panel.

1. When changing the mode from “STANDBy” to either “SPA” or “POOL” there may be up to a 10-second delay for the blower fan to begin running. The control performs an internal self-test and then verifies that the blower vacuum switch contacts are open before energizing the blower.
2. It is normal for the heater to display a 1- to 2-second delay in responding to any keypad input.
3. It is normal for the heater to display up to a 5-second delay when the keypad is used to reset the control to clear an error code.
4. The control will accept a mode change during lockout after 5 seconds. The control will continue to display the error code and remain in lockout until it is reset. At reset the control will go to the last saved mode.

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

AUTOMATIC RESET TIME:

The heater will automatically reset when an error condition is corrected and resume operation as detailed in the table below. The heater can be manually reset using the keypad by cycling the mode button through “STANDBY” and back to the original operating mode (“SPA” or “POOL”).

PERIODIC INSPECTION:

The heater is designed and built for long performance life when installed and operated according to the manufacturer’s directions. Regular inspection by qualified service personnel is recommended to keep the heater working properly. The following inspection points are suggested to help maximize heater life.

1. Periodically check the venting on outdoor heaters. The heater’s venting areas (the louvered top panel) must never be obstructed in any way and minimum clearances must be observed to prevent restriction of combustion and ventilation air. Remember that shrubs grow and in time may obstruct a heater’s venting areas.
2. Check the venting of indoor heaters for looseness and possible leaks. Keep all openings for combustion and ventilation air clear and unobstructed.
3. Keep the entire pool heater area clean and free of all debris, combustible materials, gasoline, and other flammable vapors and liquids. Remove any leaves or paper from around the heater.
4. Do not store chlorine, other pool chemicals, or other corrosives in the vicinity of the heater.
5. If the heater is operating on propane gas, the tank must not fall below 30% full or damage to the heater may occur. Hayward will not be responsible for heaters that soot up due to improper gas level in the tank resulting in inadequate gas volume.
6. If another appliance is added to the gas line at a later date, consult the local gas company to be sure the gas line will have the capacity to supply both units at full input rating at the same time.
7. Do not use the heater if any part has been under water. Contact a qualified service technician to inspect the entire heater and replace any part of the control system or gas valve that was under water. If heater has been totally submerged in water it must be removed and the entire heater must be replaced.
8. An inspection program is a good preventative maintenance measure. Keep this manual in a safe place for future reference for yourself as well as for a service technician to consult when inspecting or servicing the heater. Additional inspection procedures to be performed by a qualified service technician are covered in Section VI of this manual.

WINTERIZATION:

In moderate climates, the heater can continue to operate during short-term cold spells. Do not use the heater to maintain the water temperature just above freezing or for freeze protection. Care must be taken to avoid freeze-up in the heater. When it is used during freezing weather, the pump must run continuously. The heater is not warranted against freeze-ups. In regions where freezing temperatures are encountered, all water must be drained from the heater when it is out of service, to prevent damage to the heater and piping. Draining the heat exchanger is recommended as part of the season’s shutdown procedures.

ATTENTION: A heater damaged by freezing is not covered under the Hayward warranty.

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

HAYWARD® Pool Products
A Hayward Industries, Inc. Company

DRAINING THE HEAT EXCHANGER:

This procedure applies to installations where the heater is located higher than the pool water level. If it is necessary to drain a pool heater located below the pool water level, you must either partially drain the pool, or isolate the pool heater from the pool using valves.

1. Set the heater to STANDBY mode using the keypad.
2. Turn the electricity to the heater OFF at the circuit breaker panel.
3. Turn the heater gas valve OFF using the knob or switch on the valve (see Figure 22).
4. Turn the heater's gas supply OFF at the main shut-off valve outside the heater cabinet.
5. Be sure the circulating pump is OFF.
6. On models with plastic headers, remove the plastic drain plug (see Figure 24). On models with bronze headers (ASME models), open the brass drain valve located on the header (see Figure 17).
7. Allow all water to drain from the heater.
8. On models with plastic headers, re-install the plastic drain plug. On models with bronze headers (ASME models), close the brass drain valve located on the header.

SPRING START-UP:

1. Inspect and clean the heater, being sure the heater is free of leaves and debris prior to startup.
2. Be sure inlet and outlet piping are properly attached to the heater and the drain valve is closed.
3. Turn the filtration system pump "ON" and allow the system to run long enough to purge all the air from the lines.
4. Turn the gas supply to the heater "ON".
5. Set the temperature control using the keypad to "POOL" or "SPA" and adjust the set point to the desired temperature setting.
6. If operating difficulties are encountered, contact a qualified service company for assistance.

ATTENTION: Heater installation, checkout, and start-up should now be completed. BE SURE to leave the Owner's Manual with the pool owner.

Figure 24: Heat exchanger header components

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

SECTION IV. QUALIFIED TECHNICIAN – MAINTENANCE & SERVICING

GENERAL:

ATTENTION: Only qualified service technicians, with appropriate test equipment, should be allowed to service the heater. Bear in mind that all of the components that comprise the system have an effect on heater operation. Before proceeding with heater related troubleshooting tips covered in Section VII, be certain that the pump is operating correctly, the filters and strainers are not blocked, the valves in the piping are properly positioned, and the time clocks are properly set.

WARNING: EXPLOSION HAZARD Do not modify the heater in any manner. To do so may result in a malfunction that could result in death, personal injury, or property damage. Check with the consumer to see if any part of the heater has been under water. Replace any part of the control system and any gas control that has been under water.

MAINTENANCE:

The following inspection procedures are recommended to be performed as part of annual heater maintenance and to ensure safe operation.

1. External heat exchanger
2. Internal heat exchanger
3. Main burner flame patterns
4. Main burner orifices
5. Operating controls

EXTERNAL HEAT EXCHANGER INSPECTION AND CLEANING:

Remove the louvered exhaust cover panel (see Figure 8) and inspect the external surfaces of the heat exchanger for soot accumulation. If soot has accumulated, it must be removed by following the recommended procedure:

1. Turn pump, main gas valve, and heater power “OFF”.
2. If the heat exchanger must be removed, follow the procedure in Section II, under “Reversible Water Connections”.

WARNING: BURN HAZARD Do not use a wire brush to remove soot from the heat exchanger. This could cause a spark and ignite the gases trapped within the soot.

3. Using a soft-tipped brush such as a paint brush, apply a degreaser to the entire heat exchanger surface (top and bottom). Allow the heat exchanger to sit for a period of time to allow the degreaser to loosen the soot. Wash the heat exchanger using a garden hose ensuring both the top and bottom surfaces are cleaned. Re-assemble the heater by reversing the disassembly steps.

Although the heat exchanger should be cleaned of soot and reinstalled, the fact that sooting occurred should be investigated, as it may indicate other problems such as:

- Insufficient air supply
- Inadequate venting
- High or low gas pressure

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

HAYWARD® Pool Products

A Hayward Industries, Inc. Company

- Blockage of burner tubes or orifices
- Blockage of blower inlet
- Low voltage supply causing blower to “spin” slower
- Improper heater location installation
- Incorrect gas supply pipe size
- Excessive water flow through heat exchanger
- LP tank below 30% full

COMBUSTION CHAMBER:

The combustion chamber is a single-piece casting. If damaged, the entire chamber must be replaced.

BURNER INSPECTION AND CLEANING:

With the heater “ON”, remove the front access panel and make a visual inspection of the main burners through the sight glass (see Figure 21.) The main burner flames should be about $\frac{1}{2}$ ” to 2” in height and should not “lift” off the burner ports (see Figure 25).

A normal flame is blue, without yellow tips. yellow tips or a totally yellow or “lazy” flame may be an indication of a fuel-rich mixture due to restricted air supply. Spider nests in the burner and/or gas orifices may also cause yellow tips.

BURNER REMOVAL AND REPLACEMENT:

Refer to Figure 8, Figure 21, and Figure 22 as needed.

1. Turn pump, gas supply, and heater power “OFF”.
2. Turn gas valve knob “OFF”.
3. Remove the front access panel.
4. Disconnect the union joint in the gas supply piping outside the heater cabinet.
5. Disconnect the wiring terminals from the gas valve.
6. Disconnect the wiring terminals from the blower.
7. Remove the gas manifold assembly. It is attached to the air box using (4) screws.
8. Remove the screws from the igniter access panel and pull it out of the way. Do not disconnect the wires.
9. Remove the air box cover. Do not remove the blower from the air box cover.
10. Remove the (2) screws securing each burner to the combustion chamber front.

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

11. Pull the burners straight out of the heater.
12. Reverse the above procedure to install the burners.
13. Turn the gas supply "ON". Use a soapy water solution to check for leaks.
Bubbles forming indicate a leak.

WARNING: EXPLOSION HAZARD leaks could cause an explosion resulting in severe injury and/or death

GAS VALVE REPLACEMENT:

Refer to Figure 8, Figure 21, and Figure 22 as needed.

ATTENTION: Do not attempt to repair the gas valve. If found defective, replace the entire valve. Attempts to repair it will void the warranty.

1. Turn pump, gas supply, and heater power "OFF".
2. Disconnect the union joint in the gas supply piping outside the heater cabinet.
3. Remove the front access panel.
4. Disconnect the wiring terminals from the gas valve.
5. Remove the gas manifold assembly. It is attached to the air box using (4) screws.
6. Unscrew the gas valve from the gas manifold pipe.
7. Reassemble the gas manifold assembly using the new gas valve. Only use liquid pipe thread sealant on the male threads of the gas manifold pipe. Do not place pipe dope on the first two threads of any joint.
8. Reverse the above procedure to re-install the gas manifold.

IGNITER REPLACEMENT:

Refer to Figure 8 and Figure 21 as needed.

To remove the igniter:

1. Turn pump, gas supply, and heater power "OFF".
2. Remove the front access panel. It is secured with (4) screws.
3. Disconnect the igniter wires from the ignition control board.
4. Remove the screws from the igniter access panel. Working from the underside of the panel, press the bushing out of the hole in the sheet metal panel.
5. Slide the igniter wires through the slot on the panel and pull the panel free.
6. Remove the (2) screws that secure the igniter.
7. Pull the igniter straight back until it is free of the combustion chamber, then out of the air box.
8. Reverse the above procedure to install the igniter.

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

HAYWARD Pool Products
A Hayward Industries, Inc. Company

FLAME SENSOR REPLACEMENT:

Refer to Figure 8 and Figure 21 as needed.

To remove the flame sensor:

1. Turn pump, gas supply, and heater power “OFF”.
2. Remove the front access panel (4 screws).
3. Disconnect the wire from the flame sensor.
4. Remove the screws that secure the flame sensor to remove the sensor.
5. Reverse the above procedure to install the flame sensor.

BURNER ORIFICE REPLACEMENT:

Refer to Figure 8 and Figure 21 as needed.

To remove the burner orifices:

1. Turn pump, gas supply, and heater power “OFF”.
2. Disconnect the union joint in the gas supply piping outside the heater cabinet.
3. Remove the front access panel. It is secured with (4) screws.
4. Disconnect the wires from the terminals on the gas valve.
5. Remove the gas manifold assembly. It is attached to the air box using (4) screws.
6. Remove the orifices using a 7/16” wrench.
7. After cleaning or replacing orifices re-install into the gas manifold pipe being careful not to cross-thread or over tighten as a leak may result.

 **ATTENTION:** Do not enlarge orifice holes.

GAS CONVERSION:

The factory-installed gas train, where appropriate, may be changed from natural gas to propane or from propane to natural gas, using the appropriate conversion kits available from the factory. Gas conversions are to be performed only by a qualified service agency. Detailed instructions are included with each kit.

ELECTRICAL WIRING:

 **ATTENTION:** If it is necessary to replace any of the original wiring, it must be replaced with **Hayd** supplied replacement parts.

IGNITION CONTROL SYSTEM:

The ignition control system in this heater consists of 3 printed circuit boards (the ignition control board, the display board, and the fuse board) and a keypad. The locations of these components are shown in Figure 21. The ignition control system functions as the heater’s thermostat, safety control system, and controller for the gas combustion system.

To remove/replace the ignition control board or the fuse board:

1. Turn pump, gas supply, and heater power OFF.
2. Remove the front access panel.
3. Disconnect all wires from the printed circuit board.

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

4. Detach the board from the sheet metal panel by compressing the plastic standoffs.
5. Replace the board, and reverse the above steps to reassemble.

To remove/replace the display board or keypad:

1. Turn pump, gas supply, and heater power OFF.
2. Remove the front access panel.
3. Unplug the display board ribbon cable from the ignition control board.
4. Remove the 4 screws and remove the plastic bezel & keypad assembly from the sheet metal panel on the front of the heater.
5. The display board is attached to the back side of the bezel & keypad assembly. Unplug the keypad ribbon cable from the display board.
6. Detach the board from the plastic bezel by removing the 2 small screws.
7. Replace the display board or bezel & keypad assembly, and reverse the above steps to reassemble.

BLOWER VACUUM SWITCH:

The blower vacuum switch is a safety device that prevents the ignition sequence from continuing unless the blower is developing sufficient airflow for combustion. Figure 21 shows the location of the blower vacuum switch in the heater cabinet. When the blower achieves sufficient airflow, the negative pressure created in the blower housing closes the contacts on the blower vacuum switch, indicating to the ignition control board that it is safe to continue the ignition sequence. A silicone tube connects the blower vacuum switch with the blower as shown in Figure 21.

To remove the blower vacuum switch:

1. Turn pump, gas supply, and heater power "OFF".
2. Remove the front access panel.
3. Remove the wires from the vacuum switch.
4. Pull the tubing from the hose barb on the switch.
5. Remove the (2) screws that secure the pressure switch to the control panel.
6. Reverse the above procedure to install the blower vacuum switch.

HIGH LIMIT SWITCHES:

The high limit is an automatically resetting safety device wired in series with the thermostat and gas valve. See Figure 24. The heater is equipped with two automatic high limits, located on the water header. If the water temperature exceeds the limit set point, the gas valve will be closed, shutting off gas supply to the burners.

Erratic high limit operation is often an indication of a problem with water flow. Reduced flow may be caused by:

1. Clogged filter or strainer.
2. Excessive flow through the external bypass if one is used.
3. Lime scale accumulation in the heat exchanger.

To replace a high limit switch:

1. Turn pump, gas supply, and heater power "OFF".
2. Drain the heat exchanger of all water.
3. Unplug the high limit wires from the wiring harness.

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

4. Unscrew the high limit switch from the header.
5. Replace the high limit switch. Use new sealant on the high limit switch threads before reinstalling.
6. Reverse the above procedure to install the high limit switch.

VENT PRESSURE SWITCH:

The vent pressure switch is a safety device that disables the unit when the flue opening is blocked, which prevents sufficient airflow through the unit. Figure 21 shows the location of the vent pressure switch in the heater cabinet. When the flue is blocked, pressure is created and opens the contacts on the vent pressure switch, indicating to the ignition control board to deactivate the unit. A silicone tube connects the vent pressure switch with the blower as shown in Figure 21.

To remove the vent pressure switch:

1. Turn pump, gas supply, and heater power “OFF”.
2. Remove the front access panel.
3. Remove the wires from the pressure switch.
4. Pull the tubing from the hose barb on the switch.
5. Remove the (2) screws that secure the pressure switch to the control panel.
6. Reverse the above procedure to install the vent pressure switch.

EXHAUST GAS TEMPERATURE LIMIT:

The exhaust gas temperature limit monitors the flue gas temperature above the heat exchanger and trips if temperature rises high enough to indicate that the heat exchanger has been damaged and is no longer transferring heat to the pool water effectively. If this limit trips, effort must be made to rectify the situation that has damaged the heat exchanger. This is generally due to low water flow, poor water chemistry, or a combination of these and other factors. Replace the limit as well as the heat exchanger before operating the unit again. Running the unit without replacing the heat exchanger after this limit trips could damage the entire unit and will not be covered by Hayward’s warranty.

To replace the exhaust gas temperature limit:

1. Turn pump, gas supply, and heater power “OFF”.
2. Remove the upper end cap on the header side of the unit (see Figure 8).
3. Unplug the two wires from the exhaust gas temperature limit located in the flue collector panel above the middle of the header.
4. Unscrew the (2) screws securing the limit to the panel and remove the limit and gasket.
5. Place the new limit and gasket in place and reverse the above steps to complete the procedure.

THERMISTOR:

The thermistor monitors the return water temperature. See Figure 24.

To replace the thermistor:

1. Turn pump, gas supply, and heater power “OFF”.
2. Drain the heat exchanger of all water.
3. Remove the front access panel.
4. Unplug the thermistor connector from the ignition control board.
5. From outside the heater, pull the thermistor leads out of the control box and through the hole in the

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

heater chassis.

6. Unscrew the thermistor from the inlet side of the header.
7. Replace the thermistor. Use new sealant on the thermistor threads before re-installing.
8. Reverse steps above to complete the procedure.

WATER PRESSURE SWITCH:

The water pressure switch (Figure 24) is preset at the factory for most typical, deck level installations. When the heater is located above or below the level of the pool or spa, the pressure switch may require adjustment to compensate for the change in static head pressure. If adjustment is needed, the procedure is detailed in Section III, under Water Pressure Switch Test / Adjustment Procedure.

ATTENTION: Do not operate the pool heater without the function of a properly adjusted pressure switch or flow switch.

To replace the pressure switch:

1. Turn pump, gas supply, and heater power “OFF”.
2. Unplug the high limit terminals from the main wire harness.
3. Remove the (4) screws securing metal trim panel around the header.
4. Remove the wires from the pressure switch.
5. Using two ½” open-end wrenches disconnect the pressure switch from the pressure switch tubing.
6. Replace the pressure switch. Use new sealant on the pressure switch threads before re-installing.
7. Reverse steps above to complete the procedure.

TRANSFORMER:

The transformer converts the field supply voltage (either 240 VAC or 120 VAC) to a 120 VAC output for blower and igniter power, and a 24 VAC output for powering the ignition control board, control circuits, and gas valve. See Figure 21 for its location.

To replace the transformer:

1. Turn pump, gas supply, and heater power “OFF”.
2. Remove the front access panel.
3. Disconnect all wires from the transformer leads.
4. Remove the (2) screws that secure the transformer to the control box.
5. Replace the transformer. Reassembly is the reversal of steps above.

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

HAYWARD® Pool Products
A Hayward Industries, Inc. Company

BLOWER:

The blower provides the air that mixes with the gas at the main burners for the combustion process. The blower operates during the pre-purge time (approximately 30 seconds) at the beginning of each ignition cycle, during the entire time the gas valve is open and the burners are firing, and for 30 seconds after the valve gas closes. See Figure 21 and Figure 26.

To replace the blower:

1. Turn pump, gas supply, and heater power “OFF”.
2. Remove the front access panel.
3. Disconnect the blower wire harness from the ignition control board.
4. Disconnect the tubing from the hose barb on the blower housing.
5. Remove the blower air inlet plate from the blower (4 screws).
6. Remove the blower from the air box cover (4 screws).
7. Reverse the above steps to reassemble the blower. Be sure the blower outlet gasket is in place before proceeding.

ByPASS SERVICE CARTRIDGE:

The following procedure details how to remove and replace the internal pressure bypass valve in the header. This procedure applies only to plastic (non-ASME) headers. On bronze (ASME) headers, the bypass service cartridge is not field-replacable. Please contact Hayward technical support for more information.

1. Turn pump, main gas valve, and heater power off.
2. Drain heat exchanger according to instructions in Section III of this manual.
3. Remove 6 screws and remove the upper plastic heater side panel, to allow access to the header.
4. Remove the cartridge retaining nut from end of header (see Figure 24).
5. Slide out the bypass cartridge from the end of the header (see Figure 24).
6. Check the function of the bypass valve to ensure the valve flaps rotate smoothly on the shaft, and the spring fully closes the valve.
7. Apply silicone o-ring grease (Hayward Jack's 327 Multilube p/n SP032712, or equivalent) on o-ring seals on the bypass cartridge before inserting into the header.
8. Insert bypass cartridge into header with the arrow on the end of the cartridge pointing up.
9. Re-install cartridge retaining nut. Nut should be tightened hand-tight only. **DO NOT OVER-TIGHTEN.**
10. Re-install the upper plastic heater side panel.

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

SECTION V. TROUBLESHOOTING

GENERAL:

⚠ ATTENTION: These instructions are intended for the use of qualified personnel trained and experienced in the installation and servicing of this type of heating equipment and its related system components. Some states may require installation and service personnel to be licensed. Persons not qualified should not attempt to repair this equipment according to these instructions. These instructions and procedures are not for the use of “do-it-yourself” consumers.

⚠ WARNING: BURN HAZARD The operation of the heater with the pump shut off could cause heater overheating and fire. Never operate heater with the pump shut off.

⚠ ATTENTION: As a preliminary check, make sure that all wire connections are clean and tight and that all wiring conforms to the wiring diagram.

AUTOMATIC RESET TIME:

The heater will automatically reset when an error condition is corrected and resume operation. The heater can be manually reset using the keypad by cycling the MODE button through “STANDBY” and back to the original operating mode (“POOL” or “SPA”).

ERROR CODES:

See Figure 27 on page 51 for an error code chart.

TROUBLESHOOTING:

See Figure 28 on page 53 for troubleshooting guide.

SUPPLY WIRING:

If the heater is connected to the line side of the circuit it will be powered at all times. In this situation, when the pump shuts down the heater will display a fault code of “LO”. If there is a call for heat and the pump then restarts there will be a 2-minute delay for the heater to fire. After the pump has been running for at least 2 minutes there is no delay for heater operation.

Wiring the heater to the load side of the timer or controller will not result in a 2-minute delay if the pump primes quickly enough to activate the heater’s water pressure switch. If the pump is slow to prime the heater may display an “LO” fault code and will take 2 minutes to automatically restart. If the pump has primed, this wait can be avoided by manually clearing the error code via the keypad by changing the mode through the “STANDBY” setting and returning to the initial setting (“SPA” or “POOL”).

When a heater is wired to the line side of the power circuit (continuous power) the blower will not operate when the pump is cycled via a time clock or other switch method.

INTERNAL WIRING:

If the heater display is blank after the electrical has been installed, refer to Figure 27 and Figure 28 to determine the cause. The ribbon cable between the display board and the ignition control board is polarized and cannot be inserted upside down if it was removed when electrical was done.

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

FUSE SPECIFICATIONS:

The fuse designations are printed on the ignition board and the control board. See Figure 21 for board locations. Fuses are available as common hardware items or may be purchased from Hayward in a service parts kit. The fuse specifications are:

- F1 fuse (low voltage): 3A blade style fast-acting automotive fuse, type 257
- FC1 & FC2 (transformer primary) and FC4 (transformer secondary): 3A slo-blo fuse, 5 x 20 mm

GUARANTEEDPARTS.COM

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

Figure 27: **Error codes**

Code	Description	Information
bD	Internal fault/power-up error	On initial trial for ignition. Automatic reset is immediate once the gas valve relay check results are acceptable.
bD	Gas valve sensed as “ON” error	If valve is open when it should be closed the heater will shut down and go into lockout. Blower will operate until error condition is corrected. Automatic restart 2 minutes after error is corrected.
bD	Gas valve sensed as “OFF” error	If valve is closed but flame is sensed the blower will run for 5 s then start a new ignition sequence. If error occurs 10 times during a call for heat the control will go into lockout. Automatic reset is 60 minutes.
bD	Data retrieval error	If control input data is corrupted the heater will shut down and go into lockout.
HF	Flame present with gas valve “OFF” error	If flame is sensed with the gas valve off the control will go into lockout. The blower will run until error condition is corrected. When corrected, control will run blower for 5 s then automatically restart after 2 minutes.
PF	Electrical supply wiring error	This code will display if 120V polarity is reversed, low voltage is detected, or if the ground path is not sufficient. Reset is immediate after error is corrected.
AO	Blower vacuum switch open error	If the blower prover switch does not close after the blower starts the control will stop the ignition trial go into lockout. The blower will continue to run. Automatic reset is immediate after the switch closes.
AO	Blower vacuum switch open when expected closed error	If the blower prover switch opens unexpectedly during operation the control will shut down and attempt to re-light. If the switch does not close after the blower starts the control will go into lockout with the blower running. Automatic reset is immediate after error is corrected.
AO	Blower vacuum switch open during post-purge error	If the blower prover switch opens during the post purge cycle (heater is not firing) the control will display the error code. The post-purge cycle will be completed once the blower prover switch closes.
AC	Blower vacuum switch closed when expected open error	If the blower prover switch is closed before blower start-up the control will not start the blower. Automatic reset is immediate when the switch opens.
IO	Igniter open error	If the control is not in lockout and senses that the igniter circuit is open when the blower is running the control will turn off the blower and go into lockout. Automatic restart 2 min after error is corrected.
SF	Thermistor error	An excessive temperature difference between the two thermistors (5 °F or more) or an “out of bounds” condition on both sensors (less than 10°F or greater than 180°F) will result in the error code. Automatic restart is 2 minutes after the error is corrected.

Figure 27: **ERROR CODES** (continued)

Code	Description	Information
HS	Water Temperature Sensing Error	<p>A) Inlet water temperature sensor is reporting a temperature in excess of 104°F. Normal operation resumes 2 minutes after inlet water temperature sensor reports temperatures of 104°F or less. This error functions in both normal and remote thermostat modes.</p> <p>or</p> <p>B) Inlet water temperature sensor is reporting a temperature change at a rate faster than 6°F in 60 seconds or less while the heater is firing, indicating a potentially damaging low water flow condition. Normal operation resumes when temperatures stabilize. If this condition is detected 3 times in a one hour period, the heater will lock-out until the electrical power is cycled off and back on.</p>
Sb	Keypad button stuck closed error	If one of the keypad buttons is closed (or pressed) for more than 30 s the error code will be displayed but the control will continue to function. The error code will be cleared when the condition is corrected.
IF	Ignition failure error	If the control exceeds the maximum number of ignition retries or recycles the heater will shut down and go into lockout. Automatic reset is 60 minutes.
CE	Communication error	If communication between the ignition board and the display board is not established within 3 s of power-up an error will be displayed. After communication is established, if it is lost for 30 s, the error will be displayed. The error code will be cleared upon a valid data exchange between boards.
LO	Limit string open error	If the limit string opens the heater shuts down and goes into lockout. Automatic restart is 2 minutes after the error condition is corrected and the limit string closes. See the troubleshooting section for more detail.
EE	EEPROM ERROR	An error was detected in the ignition control circuit board.

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

Figure 28: **TROUBLESHOOTING**

Code	Fault	Diagnosis Step	Remedy
None	Heater will not power up.	1. Check for Low & High Voltage Output from Fuse Board	Disconnect plug from P5 connector from Fuse Board. Measure for 24VAC between pins of receptacle on Fuse Board. Reconnect plug. Disconnect plug from P6 of Fuse Board. Measure for 120VAC between pin 3 and 5 of receptacle on Fuse Board. Reconnect plug. If OK, proceed to section titled "Low voltage circuit fault". Otherwise, proceed to step 2.
		2. Ensure field power supply to heater is turned on. 3.	Measure for field supply voltage across terminals of TB1 terminal block on Fuse Board. If OK, proceed to step 3 Insoect Fuse Board
		Check for faulty Fuse Board wiring. 4. Verify that FC1	wiring. Ensure all plugs are securely fastened to Fuse Board. If OK, proceed to step 4.
		and FC2 Fuses on Fuse Board are not open.	Remove FC1 and FC2 fuses from fuseholder. Measure continuity across fuse. If fuses are open, proceed to section titled "Open FC1 and/or FC2 Fuses". If fuses are OK, reinstall them and proceed to step 5.
		5. Verify that 240vac Voltage Selector Plug is not installed with a 120vac field power supply	Check that proper Volatage Selector Plug is installed in Fuse Board. If OK, proceed to step 6
		6. Check for defective Transformer.	Disconnect plug from P4 connector from Fuse Board. Mesure for 24VAC between pins 1 & 2 of plug of Transformer and 120VAC between pins 4 & 6. If 24VAC or 120VAC is not present, replace Transformer. Otherwise, proceed to step 7.
		7. Fuse Board is defective	Replace Fuse Board.
	Low voltage circuit fault.	1. Check for Low Voltage Output from Fuse Board	Diconnect plug from P5 connector from Fuse Board. Measure for 24VAC across pins. Reconnect plug. If OK, proceed to step 2. Otherwise, proceed to step 5. Inspect Control Module wiring. Ensure
		2. Check for faulty Control Module wiring.	all plugs are securly fastened to Control Module. If OK, proceed to step 3. Verify 24VAC across R and C terminals on Control Module. If not OK, replace harness. If OK, proceed to step 4 Remove F1 fuse
		3. Verify low voltage input to Control Module.	from fuseholder. Measure continuity across fuse. If OK, replace Control Module. If fuse is open, proceed to section titled "Open FC3
		4. Verify that F1 Fuse on Control Board is not open.	or FC1 Fuses". Remove FC3 fuse from fuseholder. Measure continuity across fuse. If fuse is open, proceed to section titled "Open FC3 or FC1 Fuses". If OK, reinstall fuse and proceed to step
		5. Verify that FC3 on Fuse Board is not open	6. Disconnect plug from P4 connector from Fuse Board. Mesure for 24VAC between pins 1 & 2 of plug from transformer. If 24VAC is not present, replace Transformer. Otherwise, proceed to step 7. Replace Fuse Board
		6. Check for defective Transformer.	
		7. Fuse Board is defective	

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

Figure 28: **TROUBLESHOOTING**

Code	Fault	Diagnosis Step	Remedy
None	Open FC1 and/or FC2 Fuses.	1. Verify that 120VAC Voltage Selector Plug is not installed with a 240VAC field power supply.	Check that proper Voltage Selector Plug is installed. If OK, proceed to step 2. If 120VAC plug is installed and field supply voltage is 240VAC, FC1 and FC2 fuses will have to be opened. Install the correct Voltage Selector Plug and new FC1 and FC2 fuses.
		2. Check for faulty Transformer wiring.	Inspect Transformer wiring. Ensure insulation on wiring is not worn. If OK, proceed to step 3.
		3. Defective Transformer	Replace Transformer.
	Open FC3 and/or F1 Fuses	1. Check for faulty Gas Valve wiring.	Inspect Gas Valve wiring. Ensure insulation on wiring is not worn. If OK, proceed to step 2.
		2. Verify that Gas Valve is not defective.	Measure for resistance across Gas Valve terminals and between each terminal and ground. If short exists, replace Gas Valve. If OK, proceed to step 3.
		3. Check for faulty Control Module wiring.	Inspect Control Module wiring. Ensure insulation on wiring is not worn. If OK proceed to step 4.
		4. Control Module is defective.	Replace Control Module.
	Open FC4 Fuse.	1. Check for faulty Igniter wiring.	Inspect Igniter wiring. Ensure insulation on wiring is not worn. If OK, proceed to step 2.
		2. Check for faulty Blower wiring.	Inspect Blower wiring. Ensure insulation on wiring is not worn. If OK, proceed to step 3.
		3. Check for defective Igniter.	Disconnect Igniter plug from Control Module. Measure resistance across Igniter. Resistance should be 10.9-19.7 ohms at at 77°F. If out of this range, replace igniter. If OK, proceed to step 4
		4. Check for defective Blower.	Disconnect Blower plug from Control Module. Measure resistance across Blower windings. Winding resistance across lead should be in the following range: Red-to-White: 4 to 5 ohms. If measured values vary substantially from these values, blower is defective. Replace. Otherwise proceed to step 5.
		5. Control Module is defective.	Replace Control Module.
bD	Bad Board or Secondary High Voltage Fault	1. Verify that FC4 Fuse on Fuse Board is not open.	Remove FC from fuseholder. Measure continuity across fuse. If OK, reinstall fuse and proceed to step 2. If Fuse is open, proceed to section titled "Open FC4 Fuse".
		2. Verify high voltage output from Fuse Board.	Disconnect plug from P6 connector of Fuse Board. Measure for 120VAC across pins 3 and 5 of P6 receptacle on Fuse Board. If OK, reconnect plug and proceed to step 3. If not OK, go to step 4.
		3. Check for defective Harness. 4. Check for defective Transformer.	Disconnect plug from E10 connector of Control Module. Measure for 120VAC across pins 1 and 3 of Plug on Harness. If OK, replace Control Module. If not OK, replace Harness. Disconnect plug from P4 connector of Fuse Board. Measure for 120VAC between pins 4 and 6 of plug from Transformer. If OK, proceed to step 5. If not OK, replace Transformer.

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS**HAYWARD** Pool Products

Figure 28: **TROUBLESHOOTING**

Code	Fault	Diagnosis Step	Remedy
bD	Bad Board or Secondary High Voltage Fault	5. Fuse Board is defective	Replace Fuse Board.
EE	Bad Board	1. Defective Control Module	Replace Control Module.
CE	Communication Error between Control Module and Display Interface Assembly	1. Disconnect and then reconnect power to heater.	
		2. Check for faulty wiring or connection.	Inspect Display Interface Wiring. Ensure Display Interface Plug is securely attached to Control Module. If OK, proceed to step 2.
		3. Control Module and/or Display Interface Assembly are defective.	Replace Control Module and/or Display Interface Assembly.
IO	Igniter Failure	1. Check for faulty wiring or connection.	Inspect Igniter wiring. Ensure Igniter Plug is securely attached to Control Module. If OK, proceed to step 2.
		2. Igniter is defective	Replace Igniter.
Sb	Keypad Failure	1. Keypad is defective	Replace Display Interface Assembly.
SF	Temperature sensor input failure	1. Check for faulty wiring or connection.	Inspect sensor wiring. Ensure sensor is plugged into back of control module. If OK, proceed to step 2.
		2. Sensor is defective	Replace temperature sensor.
HS	Water Temperature Sensing Error	1. Check remote thermostat setting	Verify set point setting of remote thermostat is at or below 104°F. If set point of remote thermostat is OK, or if heater is not configured for remote thermostat, proceed to step 2.
		2. Verify that the water flow is adequate	Verify that water flow to heater is above minimum required (20 GPM for H150FD and H200FD, 25 GPM for H250FD and H300FD, 30 GPM for H350FD and H400FD). Note that intermittent periods of low water flow will cause this error. If OK, proceed to step 3.
		3. Check inlet water temperature sensor	Compare the heater's temperature reading to the pool water temperature with an accurate thermometer. If significantly different, replace inlet water temperature sensor.
HF	Flame Present with Gas Valve not Energized	1. ICB is defective	Using the sight glass, check to see if the flame is present in the unit. If not, replace ICB. If flame is present, move to next step. Without disconnecting the valve from the wiring harness, use a voltmeter to determine if 24 VAC is present at the gas valve connections. If so, replace ICB. If not, move to step 3.
		2. Gas Valve is defective	Replace Gas Valve
LO	Water pressure switch fault	1. Verify that the pump is running.	This is a normal display when the pump is off. Turn pump on. LO code should clear. If LO does not clear, proceed to step 2.
		2. Verify that water flow is adequate	Verify that water flow rate to heater is above minimum required (20 GPM for H150FD and H200FD, 25 GPM for H250FD and H300FD, 30 GPM for H350FD and H400FD). If OK, proceed to step 3
		3. Check for faulty wiring or connection.	Inspect water pressure switch wiring. Ensure wire harness terminals are securely fastened to spade terminals on water pressure switch. If OK, proceed to step 4.

Figure 28: **TROUBLESHOOTING**

Code	Fault	Diagnosis Step	Remedy
LO	Water pressure switch fault	4. Verify state of water pressure switch contacts.	Remove wire leads from water pressure switch and measure continuity across water pressure switch with the pump running. If open, proceed to step 5. If closed, LO code is not caused by water pressure switch fault. Reconnect wire leads to water pressure switch. Clean filter or clear blockages. Check position of
		5. Ensure that low pump pressure does not exist.	valves in plumbing system. If OK proceed to step 6. Adjust water pressure switch setting as shown on page 35 of Installation Manual
		6. Check for correct water pressure switch setting.	(only if heater is above or below water level). If LO does not clear, proceed to step 7.
		7. Water pressure switch is defective	Replace water pressure switch.
	Vent pressure switch fault	1. Check for faulty wiring or connection.	Inspect vent pressure switch wiring. Ensure wire harness terminals are securely fastened to spade terminals on vent pressure switch. If OK, proceed to step 2.
		2. Verify state of vent pressure contacts.	Remove wire leads from vent pressure switch and jumper leads. Operate heater. Measure continuity across vent pressure switch. If closed, LO code is not caused by vent pressure switch fault. If open, proceed to step 3. Remove jumper from wire leads and reconnect wire leads to vent pressure switch.
		3. Check for restricted or blocked flue.	Ensure that flue is not blocked or restricted. See indoor vent sizing requirements in installation manual. If OK, proceed to step 4.
		4. Vent pressure switch is defective.	Replace vent pressure switch.
	Temperature limit switch fault	1. Check for faulty wiring or connection.	Inspect temperature limit switch wiring. Ensure wire harness terminals are securely fastened to spade terminals on temperature limit switches. If OK, proceed to step 2.
		2. Verify state of temperature limits' contacts	Remove wire leads from limit switch and jumper leads. Operate heater. Measure continuity across limit switches. If closed, LO code is not caused by temperature limit switch fault. If open, proceed to step 3. Remove jumper from leads and reconnect leads to temperature limits.
		3. Verify that water flow is adequate	Verify that water flow rate to heater is above the minimum required (20 GPM for H150FD and H200FD, 25 GPM for H250FD and H300FD, 30 GPM for H350FD and H400FD). If OK, proceed to step 4.
		4. Temperature limit switch is defective.	Replace temperature limit switch.
	Exhaust gas temperature limit fault	1. Check for faulty wiring or connection	Inspect temperature limit switch wiring. Ensure wire harness terminals are securely fastened to spade terminals on temperature limit switch located in the flue collector panel above the center of the header. If OK, proceed to step 2.
		2. Verify state of temperature limit's contacts	Remove wire leads from limit switch and measure continuity across limit switch contacts. If closed, LO code is not caused by exhaust gas temperature limit switch fault. If open, proceed to step 3.

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

Figure 28: **TROUBLESHOOTING**

Code	Fault	Diagnosis Step	Remedy
LO	Exhaust gas temperature limit fault	3. Heat exchanger has been damaged	Heat exchanger has been damaged. This is generally due to low water flow, poor water chemistry, or a combination of these and other factors. Rectify all issues with water flow through the heater and water chemistry and then replace the heat exchanger and exhaust gas temperature limit. Continuing to run the heater after this limit has tripped will cause damage to the entire unit and will not be covered by the warranty.
IF	Ignition Failure	1. Ensure gas supply shutoff valves are open.	Ensure that main gas shutoff installed adjacent to heater is open. Ensure that knob on gas valve inside unit is in “on” position. If OK, proceed to step 2.
		2. Check for low gas supply pressure	Ensure inlet gas supply pressure is between the minimum and maximum values indicated on rating plate. If OK, proceed to step 3.
		3. Check for faulty flame sense wiring or connection.	Inspect flame sense wiring. Ensure wire harness terminals are securely fastened to flame sense and to control module. If OK, proceed to step 4.
		4. Check for faulty gas valve wiring or connection	Inspect gas valve wiring. Ensure wire harness terminals are securely fastened to spade terminals on gas valve. If OK, proceed to step 5.
		5. Check for gas valve failure or gas valve relay failure.	1. Measure voltage across gas valve during trial for ignition. If 24VAC is present and gas valve does not open, gas valve is defective. Replace gas valve. 2. If 24VAC is not present, gas valve relay on control module is defective. Replace control module.
		6. Check for blockages in gas orifices and burners	Inspect gas orifices for blockages which could prevent gas flow. Remove and inspect burners for blockages.
AC	Blower vacuum switch closed.	1. Check for defective blower on relay or control module.	Disconnect Blower plug from Control Module. With heater off, measure continuity across pins 1 and 2 of receptacle on Control Module. If closed, control module relay is defective. Replace control module. If OK, proceed to step 2.
		2. Vacuum switch is defective.	Replace blower vacuum switch.

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

Code	Fault	Diagnosis Step	Remedy
AO	Blower vacuum switch open.	1. Check for faulty vacuum switch tubing 2. Check for faulty vacuum switch wiring or connection. 3. Check for faulty blower wiring or connection 4. Check for defective vacuum switch	Check tubing and replace if necessary. If OK, proceed to step 2. Inspect vacuum switch wiring. Ensure wire harness terminals are securely fastened to spade terminals on vacuum switch. If OK, proceed to step 3. Inspect blower wiring. Ensure plug on blower is securely fastened to control module. If OK, proceed to step 4. Disconnect Blower plug from Control Module. Measure resistance across Blower windings. Winding resistance across lead should be in the following range; Red-to-White: 4 to 5 ohms. If measured values vary substantially from these values, Blower is defective. Replace. If OK, proceed to step 5. Disconnect Blower plug from Control Module. Place heater in Pool or Spa Mode. Lower set point temperature to generate call for heat. During pre-purge period, measure for 120VAC across pins 1 and 2. If 120VAC is not present, control module relay is defective. Replace control module. If OK, proceed to step 6
		5. Check for defective blower relay.	
		6. Vacuum switch is defective	Replace blower vacuum switch.
bO	Bypass Operation	1. Check to see if Control Module is in Bypass Operation	This is normal display when heater is being controlled by a remote thermostat. No service is required. If heater is not being controlled by remote thermostat, change setting by using the MODE key to put the heater into STANDBY. Press and hold the DOWN key and then press and hold the MODE key. Hold down both keys for 3 seconds until the indication “bO” is removed from the display.

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

HAYWARD POOL HEATER CERTIFICATE OF LIMITED WARRANTY

LIMITED HEATER WARRANTY:

TERMS AND COVERAGE:

We warrant our pool heater to be free from defects in workmanship and materials under normal use and service. Pursuant to this warranty and subject to the Conditions and Exceptions indicated below:

1. We will replace (cost of freight, installation, cost of fuel, and service labor at user's expense) with the prevailing comparable model, or, at our option, repair any pool/spa heater that leaks under normal use and service within one year from the date of original installation for all users.
2. In addition, we will replace (cost of freight, installation, cost of fuel, and service labor at user's expense) or, at our option, repair any part or parts of the pool/spa heater which malfunctions under normal use and service within one year from the date of original installation for all users.

LIMITATION ON IMPLIED WARRANTIES:

WE ARE NOT LIABLE FOR ANY CONSEQUENTIAL DAMAGES FOR BREACH OF ANY WRITTEN OR IMPLIED WARRANTY OF THIS PRODUCT. Implied warranties, including the WARRANTY of MERCHANTABILITY and all other implied warranties that may arise from course of dealing or usage of trade imposed on the sale of this heater under laws of the state are limited in duration to the term of one (1) year for all products when products are NOT installed and serviced by a licensed and qualified pool equipment professional with all sufficient experience in pool equipment installation and maintenance and adhering to the requirements of the jurisdiction where the product is installed.

Warranty extends in duration to the term of (2) years for all non-ASME certified products ONLY when products are installed and serviced by a licensed and qualified pool equipment professional with sufficient experience in pool equipment installation and maintenance and adhering to the requirements of the jurisdiction where the product is installed. There are no warranties which extend beyond the description on the face hereof. We shall not in any event be held liable for any special, indirect or consequential damages.

EXPENSE OF DELIVERY AND INSTALLATION:

Each pool heater or replacement part to be furnished under this warranty shall be furnished at our nearest distribution center. We shall not pay, nor be responsible for shipping or delivery charges to the place of installation, nor for labor charges or other costs of removal or installation. Every defective heater or part replaced under this warranty shall become our property, and as such, must be returned to our distribution center with transportation charges paid by the user. Any replacement pool heater furnished under this warranty shall remain in warranty only for the unexpired portion of this warranty.

CONDITIONS AND EXCEPTIONS:

This warranty applies only to the pool/spa at its original place of installation and only for the original owner. It does not apply if the pool heater is installed in violation of any applicable code or ordinance, or is not installed, operated and maintained in accordance with our instructions, or is misused, damaged by accident, weather, act of God, freezing, water void and/or excess pressure, altered or disconnected. It does not apply with respect to:

1. A heater not equipped with Certified C.S.A. limit controls or equivalent pressure relief valve.
2. A heater operated with settings in excess of, and/or with fuel not conforming to those shown on rating plate;
3. A heater on which the serial numbers have been altered, defaced, or removed.
4. Leaks arising from defective installation;
5. Production of noise, odors, or discolored (rusty, etc.) water;

USE ONLY HAYWARD GENUINE REPLACEMENT PARTS

6. Leakage substantially contributed to by sediment, lime precipitate and/or higher than normal dissolved solids (pH above 7.8) in the tank, copper tubes, or water ways;
7. Leakage caused substantially contributed to by corrosive elements in the atmosphere (such as the storage of chlorine or other chemicals);
8. Leakage caused substantially or contributed to by corrosive pool water in an acid condition (pH below 7.2);
9. Damage caused substantially or contributed to by an external source of energy;
10. A pool/spa heater is a water containing device. Leakage of water from this device can be expected at some time due to malfunction or the limitations of the service life of various components. Do not install this product where such leakage can cause damage. **MANUFACTURER IS NOT RESPONSIBLE OR LIABLE FOR ANY COSTS INCURRED BY SUCH DAMAGE.**

IN NO CASE ARE WE TO BE HELD LIABLE FOR DAMAGE TO SURROUNDING AREA OR PROPERTY CAUSED BY LEAKAGE OR MALFUNCTION.

HOW TO CLAIM UNDER THIS WARRANTY:

The original owner, upon discovering the defect, must present the attached completed warranty claim card with proof of purchase either to the dealer or notify Hayward in writing at the following address:

HAYWARD INDUSTRIES, INC.

620 DIVISION ST.
ELIZABETH, NJ 07207

Upon receipt of such notification we shall decide whether to repair such parts or replace any pool heater, reserving at all times the right to inspect in order to verify any claimed defect. We also reserve the right to have our representatives make any inspections, repairs, or to furnish replacements. This warranty is intended as a legally binding obligation of Hayward Industries, Inc., enforceable in the courts. This warranty may give you specific legal rights which may vary from state to state.

LIMITATION ON LIABILITY:

All intended representations have been expressly set forth in this document. This warranty may not be extended by oral or any other additional representations, written sales information, drawings, or other malfunction, is strictly limited to repair or replacement of the defective heater or part, as provided herein and Hayward Industries, Inc. is not responsible hereunder for incidental or consequential or incidental costs or damages. The company neither assumes, nor authorizes any person or firm to assume for us, any further liability or obligation in connection with the sale, installation, use, maintenance, or existence of the heater. **SAFETY WARNING:** Pool heaters are heat producing appliances and to avoid damage or injury in the event of possible overheating of the outer jacket (1) no materials should be stored against the jacket and (2) care should be taken to avoid unnecessary contact (especially by children) with the jacket. When lighting a gas heater, the lighting instructions must be followed exactly to prevent "flashback" of excess gas in the heater. Electronic ignition heaters and electric heaters must have the power shut off when making adjustments to, servicing, or coming into contact with the heater. **UNDER NO CIRCUMSTANCES SHOULD FLAMMABLE MATERIALS, SUCH AS GASOLINE OR PAINT THINNERS, BE USED OR STORED IN THE VICINITY OF THE HEATER OR IN ANY LOCATION FROM WHICH FUMES COULD REACH THE HEATER.** For your comfort, enjoyment and safety, please read the enclosed operating instructions carefully.
